Course Name

Computer Programming I

Topic: Introduction to Computer Programming

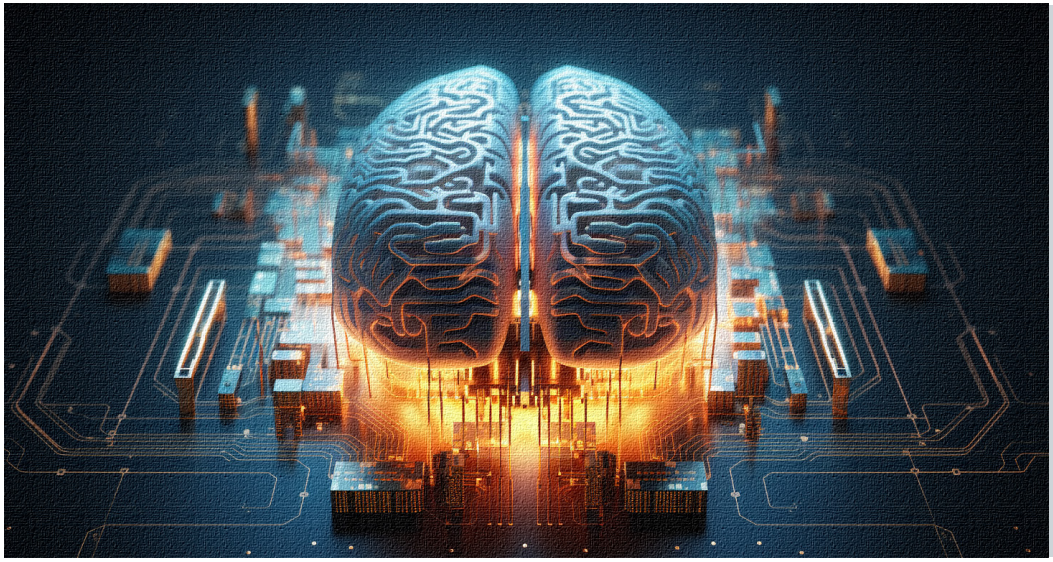

Week 1

BULLET POINT SUMMARY

This week, some of the learning points include:

- Programming is all about telling computers what to do. Like controlling smartphones, apps, and complex systems through code.
- Beyond tech, programming powers healthcare, finance, and entertainment, solving problems and automating tasks.
- It is also a creative canvas for design of games, apps, and digital experiences. Ideas come to life through programming.
- Programming is a high-demand skill. It can be in software development, AI, data science, or cybersecurity; programming opens doors to exciting careers.
- More than code, programming helps you develop problem-solving, logic, and attention to detail, which are valuable life skills beyond programming.
- Future-proof skill: AI, VR, quantum computing - programming drives innovation and helps tackle global issues.
- Bridge the gap: Programming languages let us communicate with computers, creating software and apps for everyone.

PERSONAL REFLECTION

Programming is a journey of continuous learning. Think about your experience with different programming languages or paradigms.

- What challenges did you face, and how did you overcome them?
- How does this experience reflect your approach to learning new things?

CALL TO ACTION

You are selected as a member of a hackathon team developing a web application to connect local businesses with skilled volunteers.

- Given a limited timeframe and diverse team skills, how would you approach project management, team collaboration, and efficient coding practices?
- What tools and methodologies would you leverage to ensure smooth execution and a successful prototype?

SKILLS AND COMPETENCIES YOU HAVE ACQUIRED AFTER THIS LESSON

- Programming fundamentals
- Problem-solving
- Logical thinking
- Adaptability
